60 seconds
per cylinder

TIME TO IMPROVE FIRE SAFETY.

TIME TO STOP WEIGHING.

TIME TO SAVE TIME & COST.

test your fire suppression systems

the challenges

the solutions

1. Safety critical & high value assets need protection from fire.
2. Many install a fire suppression system (FSS) that uses liquefied gaseous extinguishing agent e.g. CO₂, FM-200®, NOVEC™1230, etc.
3. Yet the agent is pressurised - it is in a dynamic state in the cylinders and thus leaks or accidental discharge may occur.
4. If this occurs, there may not be enough agent to suppress a fire.
5. This vital agent is usually inspected once a year.
6. New technology is available to quickly, easily & reliably check.
7. Choose award-winning ultrasonic technology to save you time, costs and minimise risks compared to traditional manual weighing:

Portalevel® MAX to identify the agent height and **Portasteele® CALCULATOR** to convert into the agent weight, record and download the results, taking person 60 seconds per cylinder.
